Introduction

File system filter driver

A file system filter driver intercepts requests targeted at a file system or another file system filter driver. By intercepting the request before it reaches its intended target, the filter driver can extend or replace functionality provided by the original target of the request. It is developed primarily to allow the addition of new functionality beyond what is currently available.

File system monitor filter

File system monitor filter can monitor the file system activities on the fly. With file system monitor filter, you can monitor the file activities on file system level, capture file open/create/replace, read/write, query/set file attribute/size/time security information, rename/delete, directory browsing and file close request by which user and process name. You can develop the software for the following purposes:

- Continuous data protection (CDP).
- Auditing.
- Access log.
- Journaling.

EaseFilter Filter Driver SDK Manual

File system control filter

File system control filter can control the file activities, which you can intercept the file system call, modify its content before or after the request goes down to the file system, allow/deny/cancel its execution based on the filter rule. You can fully control file open/create/replace, read/write, query/set file attribute/size/time security information, rename/delete, directory browsing these Io requests. With file system control filter, you can develop these kinds of software:

- Data protection.
- File Screening
- Access Control.
- File Security.

The rules to use of file system control filter

To use the file system control filter, you need to follow the following rules, or might cause the system deadlock.

1. Avoid the re-entrance issue, don't generate any new I/O request which will cause the request comes to the control filter handler again.
2. Avoid using any file operations in buffered mode, open any file in the control filter handler with FILE_FLAG_NO_BUFFERING flag set.
3. Avoid asynchronous procedure calls.
4. Avoid any GUI (user interface) operations.

File system encryption filter

File system encryption filter provides a comprehensive solution for transparent file level encryption. It allows developers to create transparent, on-access, per-file encryption products which it can encrypt or decrypt file on-the-fly. Our encryption engine uses a strong cryptographic algorithm called Rijndael (256-bit key), it is a high security algorithm created by Joan Daemen and Vincent Rijmen (Belgium). Rijndael is the new Advanced Encryption Standard (AES) chosen by the National Institute of Standards and Technology (NIST).

Process filter driver

Process filter driver is a kernel-mode driver that tracks and controls the process and thread operations, it provides you an easy way to develop Windows application for the Windows process monitoring and protection. Prevent the untrusted executable binaries (malwares) from being launched, protect your data being damaged by the untrusted processes.

Registry filter driver

Registry filter driver is a kernel-mode driver that tracks and controls the registry access, it provides you an easy way to develop Windows application for registry monitoring and

EaseFilter Filter Driver SDK Manual

protection, it enables your application to prevent the Windows core registry keys and values from being damaged.

Supported Platforms

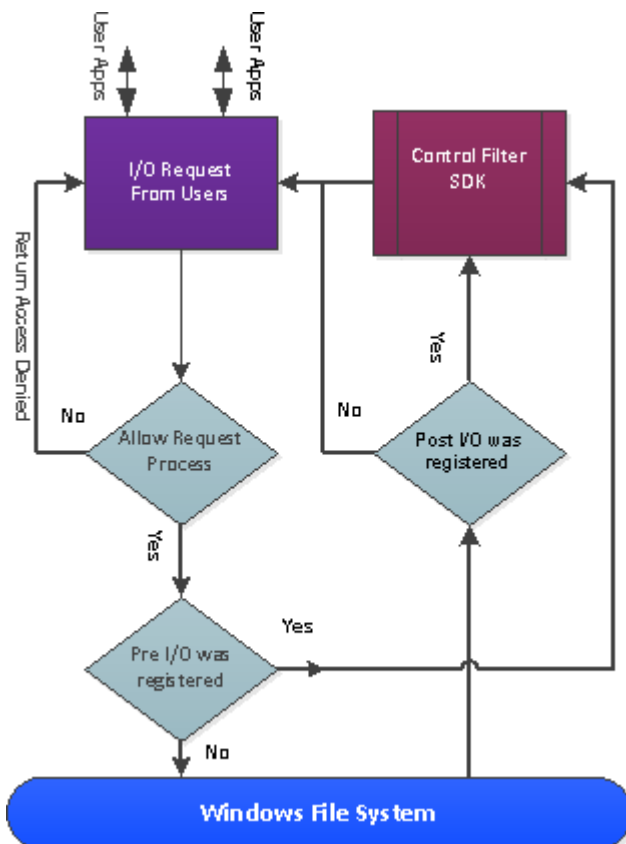

- Windows 2016/Windows 2019
- Windows 10 (32bit, 64bit)
- Windows 8 (32bit, 64bit)
- Windows 2012 Server R2
- Windows 2008 Server R2 (32bit, 64bit)
- Windows 7 (32bit,64bit)
- Windows 2008 Server (32bit, 64bit)
- Windows Vista (32bit,64bit)
- Windows 2003 Server(32bit,64bit)
- Windows XP(32bit,64bit)

Overview and Basic Concepts

The EaseFilter file system filter driver

EaseFilter file system filter driver is a kernel component module which is sitting on the layer between the I/O manager and the file system. When a user application invokes a win32 API to a file, the filter driver can intercept this I/O, based on the policies was set with the filter rule, the I/O information can be sent to the user, or be modified/blocked the access based on the setting as below figure.

EaseFilter Filter Driver SDK Manual

Filter Rule

A filter rule is the policy for the filter driver, it tells the filter driver how to manage the files. To manage the files by filter driver, you need to create at least one filter rule, you can have multiple filter rules with different policies to manage different files to meet your requirement.

A filter rule has only one unique include file mask, when a new filter rule was added to the filter driver, if a filter rule with the same include file filter mask exists, the new filter rule will replace the older one.

A filter rule has a AccessFlags to control if the file access can be proceeded, for Monitor filter driver, it always should be set with the maximum rights. If it is 0, it means this is a exclude filter rule, all the files match the include filter mask will be skipped by this filter rule. Exclude filter rules always are sitting on the top of the other filter rules.

A filter rule can register the file events (reference FileEventType), when it the file I/O events were triggered, the filter driver will send the file events message back to the user mode service.

A filter rule can have multiple exclude file filter masks, it is optional. When a file was opened, if the file name matches the exclude filter mask, the filter driver will skip this file I/O.

EaseFilter Filter Driver SDK Manual

A filter rule can have multiple include process names, process Ids, exclude process names, process Ids, include user names and exclude user names. These are optional settings.

If a filter rule has the flag `ENCRYPTION_FILTER_RULE` enabled, the encrypted data can be decrypted transparently in memory by filter driver when it was read, and the new data will be encrypted and be written to the disk when the encrypted file was written. If the flag `ALLOW_NEW_FILE_ENCRYPTION` is enabled, the new created file will be encrypted automatically.

If a filter rule has the flag `HIDE_FILES_IN_DIRECTORY_BROWSING` enabled, the filter rule can add multiple hidden file filter mask, when user browses the folder, if the file names match the hidden filter mask, they will be hidden from the user.

A filter rule only can have one unique include file mask, when a new filter rule was added to the filter driver, if a filter rule with the same include file mask already exists, then the new filter rule will replace the older one. A filter rule can have multiple exclude file masks, multiple include process names and exclude process names, multiple include process Ids and exclude process Ids, multiple include user names and exclude user names.

How to manage the file I/O with the filter rule

When an file I/O occurs, the filter driver will check the filter rule policies with the below order to decide if it should manage this file I/O or not:

- a. If the exclude filter rules (`AccessFlags` is 0) exist, the filter driver will look for all the exclude filter rules first, if the files match the include file filter mask of the exclude filter rule, the filter driver will skip this file I/O, or go to next step.
- b. Check the next filter rule, If the file name matches the include file filter mask, then go to next step, or continue step b, till no more filter rules.
- c. Check if the exclude file filter mask list is empty, if it is not empty, then it will check if the file name matches the exclude file mask, if it matches, then go to step b, or go to next step.
- d. Check if the include process name and include process Id list are empty, if they are not empty, then check if the current process name or process Id is in the include list, if not then go to step b, or go to next step.
- e. Check if the exclude process name and exclude process Id list are empty, if they are not empty, then check if the current process name or process Id is in the list, if yes then go to step b, or go to next step.
- f. Check if the include user names list is empty, if it is not empty, then check if the current user name is in the list, if not then go to the step b, or go to next step.
- g. Check if the exclude user names list is empty, if it is not empty, then check if the current user name is in the list, if yes then go to the step b, or the filter driver will manage this file I/O with this filter rule.

If the files match multiple filter rules, the filter driver will choose the deepest one.

EaseFilter Filter Driver SDK Manual

For example:

```
There are filter rule1 with include file mask c:\test\*;  
filter rule2 with include file mask c:\test\test2\*;  
filter rule3 with include file mask c:\test\test2\test3\*
```

the checking order will be rule3, rule2, then rule1. If you have a file with name c:\test\test2\test.txt, the filter driver will choose filter rule 2.

Control filter driver filter rule

For control filter driver, you not only have the same filter rule setting as the monitor filter, but also have the following extra settings:

- a. Access control of the filter rule.
- b. Access control for specific processes.
- c. Access control for specific users.
- d. Reparse file open filter rule.
- e. Hidden file filter rule.

Process filter driver filter rule

If the control filter driver and process filter driver were enabled, you can add process filter rule to control file access based on the process name or process Id. You can authorize the specific file access to the specific process.

How to manage the file I/O with the IO registration

Pre-IO and Post IO

A file IO has two steps, pre-IO and post IO. A pre-IO is the I/O process in the filter driver layer, it didn't go down to the file system, a post IO is the I/O process in the filter driver, it already went down to the file system and came back to the filter driver.

You can register the I/O message types (reference `MessageType`) you are interested, it is a global setting. When a file I/O occurs, if a file name matches a filter rule, and the file I/O was registered, the filter driver will send the I/O message to the user.

A monitor filter driver only can register the post IOs, it means it only can monitor the file I/O result, if a post IO was triggered, the filter driver will send the I/O message to the user and return back right away and won't block and wait.

A control filter driver can register all the IOs, it has the ability to control the file I/O behaviour, it can modify, allow, deny or cancel the file IO and data. When a file IO was triggered, the filter driver will send the I/O message to the user, it will block and wait for the result from the user, the filter driver will go to modify the file I/O and data or not based on the return result.

EaseFilter Filter Driver SDK Manual

An I/O message

A typical I/O message includes the file I/O type, file name, file information (file size, file attribute, file time), user name, process name and the I/O result for the post I/O.

Symbol Reference

Structures, Enums

Typedef enum FilterType

```
{  
    FILE_SYSTEM_CONTROL           = 1,  
    FILE_SYSTEM_ENCRYPTION        = 2,  
    FILE_SYSTEM_MONITOR           = 4,  
    FILE_SYSTEM_REGISTRY          = 8,  
    FILE_SYSTEM_PROCESS           = 16,  
};
```

Comments

FILE_SYSTEM_CONTROL filter type is the file system filter driver which can control the file I/O request's behaviour before it goes down to the file system or after it is completed by the file system.

FILE_SYSTEM_ENCRYPTION filter type is the file system filter driver which can encrypt and decrypt the files on-the-fly.

FILE_SYSTEM_MONITOR filter type is the file system filter driver which only intercept the file I/O notification after it was completed.

FILE_SYSTEM_REGISTRY filter type is the filter driver which can track and control the registry access.

FILE_SYSTEM_PROCESS filter type is the filter driver which can track and control the process and thread operations.

```
};
```

Members

PRE_CREATE

PRE_CREATE request is the create I/O request before it goes down to the file system.

POST_CREATE

POST_CREATE request is the create I/O request after it is completed by file system.

PRE_FASTIO_READ

PRE_FASTIO_READ is the read I/O request before it goes to the Cache Manager.

EaseFilter Filter Driver SDK Manual

POST_FASTIO_READ

POST_FASTIO_READ is the read I/O request after it comes back from the Cache Manager. If the data is not in the Cache Manager, it will return false, and the I/O Manager will reissue a new request to the file system.

PRE_CACHE_READ

PRE_CACHE_READ is the read I/O request with data cache before it goes to the Cache Manager.

POST_CACHE_READ

POST_CACHE_READ is the read I/O request after it come back from Cache Manager. If the data is not in the Cache Manager, it will trigger a paging I/O read request and load the data from the storage to the Cache Manager. Normally you will see the paging I/O read request follows the cache read request.

PRE_NONCACHE_READ

PRE_NONCACHE_READ is the read I/O request without data cache before it goes to the file system.

POST_NONCACHE_READ

POST_NONCACHE_READ is the read I/O request after it comes back from the file system. The data won't cache in the Cache Manager. You will see the noncache read request if you open a file and specify FILE_NO_INTERMEDIATE_BUFFERING.

PRE_PAGING_IO_READ

PRE_PAGING_IO_READ is the read I/O request before it goes to the file system. It is initiated by the virtual memory system in order to satisfy the needs of the demand paging system.

POST_PAGING_IO_READ

POST_PAGING_IO_READ is the read I/O request after it come back from file system. For memory mapping file open you will see this request without the cache read request, for example open file with notepad application.

PRE_FASTIO_WRITE

EaseFilter Filter Driver SDK Manual

`PRE_FASTIO_WRITE` is the write I/O request before it writes to the Cache Manager.

POST_FASTIO_WRITE

`POST_FASTIO_WRITE` is the write I/O request after it wrote to the Cache Manager. Normally you will see the paging I/O write request follows the fast I/O write request.

PRE_CACHE_WRITE

`PRE_CACHE_WRITE` is the write I/O request with data cache before it writes to the Cache Manager.

POST_CACHE_WRITE

`POST_CACHE_WRITE` is the write I/O request after it wrote to the Cache Manager. Normally you will see the paging I/O write request follows the cache write request.

PRE_NONCACHE_WRITE

`PRE_NONCACHE_WRITE` is the write I/O request without data cache before it wrote to the storage by the file system.

POST_NONCACHE_WRITE

`POST_NONCACHE_WRITE` is the write I/O request after it comes back from the file system. The data won't cache in the Cache Manager. You will see the noncache write request if you open a file and specify `FILE_NO_INTERMEDIATE_BUFFERING`.

PRE_PAGING_IO_WRITE

`PRE_PAGING_IO_WRITE` is the write I/O request on behalf of the Virtual Manager system before it writes to the storage by the file system.

POST_PAGING_IO_WRITE

`POST_PAGING_IO_WRITE` is the write I/O request after it come back from file system.

PRE_QUERY_INFORMATION

`PRE_QUERY_INFORMATION` is the I/O request which retrieves information for a given file before it goes down to the

EaseFilter Filter Driver SDK Manual

file system. The file information class tells the type of the information will be returned.

POST_QUERY_INFORMATION

POST_QUERY_INFORMATION is the I/O request which retrieves information for a given file after it comes back from the file system. The file information class tells the type of the information will be returned.

PRE_SET_INFORMATION

PRE_SET_INFORMATION is the I/O request which set information for a given file before it goes down to the file system. The file information class tells the type of the information will be set.

POST_SET_INFORMATION

POST_SET_INFORMATION is the I/O request which set information for a given file after it comes back from the file system. The file information class tells the type of the information will be set.

PRE_DIRECTORY

PRE_DIRECTORY is the folder browsing I/O request before it goes down to the file system. It retrieve various kinds of information about files in the given directory. The information class tells the type of information will be returned.

POST_DIRECTORY

POST_DIRECTORY is the folder browsing I/O request after it comes back from the file system. It retrieve various kinds of information about files in the given directory. The information class tells the type of information will be returned.

PRE_QUERY_SECURITY

PRE_QUERY_SECURITY is the query security request before it goes down to the file system. It will retrieve the security descriptor for a given file. The security information tells the the type of the security descriptor.

EaseFilter Filter Driver SDK Manual

POST_QUERY_SECURITY

POST_QUERY_SECURITY is the query security request after it comes back from the file system. It will retrieve the security descriptor for a given file. The security information tells the the type of the security descriptor.

PRE_SET_SECURITY

PRE_SET_SECURITY is the set security request before it goes down to the file system. It will set the security state for a given file. The security information tells the the type of the security descriptor.

POST_SET_SECURITY

POST_SET_SECURITY is the set security request after it comes back from the file system. It will set the security state for a given file. The security information tells the the type of the security descriptor.

PRE_CLEANUP

PRE_CLEANUP is the cleanup request before it goes down to the file system. It indicates that the handle reference count on a file object has reached zero. In other words, all handles to the file object have been closed. Often it is sent when a user-mode application has called the Microsoft Win32 CloseHandle function on the last outstanding handle to a file object.

POST_CLEANUP

POST_QUERY_SECURITY is the cleanup request after it comes back from the file system.

PRE_CLOSE

PRE_CLOSE is the close request before it goes down to the file system. It indicates that the reference count on a file object has reached zero, usually because a file system driver or other kernel-mode component has called ObDereferenceObject on the file object. This request normally follows a cleanup request. However, this does not necessarily mean that the close request will be received immediately after the cleanup request.

EaseFilter Filter Driver SDK Manual

POST_CLOSE

POST_CLOSE is the close request after it comes back from the file system.

Comments

Register the I/O request with the combination of the request type you want to monitor. For file system monitor filter, only post requests are affected.

typedef enum FilterCommand

```
{  
    FILTER_SEND_FILE_CHANGED_EVENT           = 0X00010001,  
    FILTER_REQUEST_USER_PERMIT              = 0X00010002,  
    FILTER_REQUEST_ENCRYPTION_KEY           = 0X00010003,  
    FILTER_REQUEST_ENCRYPTION_IV_AND_KEY    = 0X00010004,  
    FILTER_REQUEST_ENCRYPTION_IV_AND_KEY_ACCESSFLAG=0X00010005,  
    FILTER_REQUEST_ENCRYPTION_IV_AND_KEY_TAGDATA=0X00010006,  
    FILTER_SEND_REG_CALLBACK_INFO           = 0X00010007,  
    FILTER_SEND_PROCESS_CREATION_INFO       = 0X00010008,  
    FILTER_SEND_PROCESS_TERMINATION_INFO    = 0X00010009,  
    FILTER_SEND_THREAD_CREATION_INFO        = 0X0001000A,  
    FILTER_SEND_THREAD_TERMINATION_INFO     = 0X0001000B,  
    FILTER_SEND_PROCESS_HANDLE_INFO         = 0X0001000C,  
    FILTER_SEND_THREAD_HANDLE_INFO          = 0X0001000D  
}
```

FILTER_SEND_FILE_CHANGED_EVENT

If the monitor filter driver register the event type with API 'RegisterEventTypeToFilterRule', the notification will be sent when the file was changed.

FILTER_REQUEST_USER_PERMIT

If the file has this control flag, the filter driver will request the permission to open this file.

FILTER_REQUEST_ENCRYPTION_KEY

For encryption filter driver, if this control flag was enable for this file, the filter driver will request the encryption key for this file.

FILTER_REQUEST_ENCRYPTION_IV_AND_KEY

EaseFilter Filter Driver SDK Manual

For encryption filter driver, if this control flag was enable for this file, the filter driver will request the encryption key and IV for this file.

FILTER_REQUEST_ENCRYPTION_IV_AND_KEY_AND_ACCESSFLAG

For encryption filter driver, if this control flag was enable for this file, the filter driver will request the encryption key, IV and access flag for this file.

FILTER_REQUEST_ENCRYPTION_IV_AND_KEY_AND_TAGDATA

For encryption filter driver, if this control flag was enable for this file, the filter driver will request the encryption key, IV and tag data for this file.

FILTER_SEND_REG_CALLBACK_INFO

For registry filter driver, if the registry callback class was registered, the registry access notification will be sent whent the registry was accessed.

FILTER_SEND_PROCESS_CREATION_INFO

For process filter driver, if the `PROCESS_CREATION_NOTIFICATION` was registered, the process infomation will be sent when the new process was created.

FILTER_SEND_PROCESS_TERMINATION_INFO

For process filter driver, if the `PROCESS_TERMINATION_NOTIFICATION` was registered, the process infomation will be sent when the process was terminated.

FILTER_SEND_THREAD_CREATION_INFO

For process filter driver, if the `THREAD_CREATION_NOTIFICATION` was registered, the process infomation will be sent when the new thread was created.

FILTER_SEND_THREAD_TERMINATION_INFO

For process filter driver, if the `THREAD_TERMINATION_NOTIFICATION` was registered, the process infomation will be sent when the thread was terminated.

FILTER_SEND_PROCESS_HANDLE_INFO

For process filter driver, if the `PROCESS_HANDLE_OP_NOTIFICATION`

EaseFilter Filter Driver SDK Manual

was registered, the process information will be sent when a handle for a process was created or duplicated.

FILTER_SEND_THREAD_HANDLE_INFO

For process filter driver, if the `THREAD_HANDLE_OP_NOTIFICATION` was registered, the process information will be sent when a handle for a thread was created or duplicated.

Comments

This is the command which was sent from the filter driver with the information associated to the specific command, the filter command is the field 'MessageType' in structure 'MESSAGE_SEND_DATA'.

typedef enum VolumeControlFlag

```
{
    GET_ATTACHED_VOLUME_INFORMATION           = 0X00000001,
    VOLUME_ATTACHED_NOTIFICATION            = 0X00000002,
    VOLUME_DETACHED_NOTIFICATION            = 0X00000004,
    BLOCK_VOLUME_DISMOUNT                   = 0X00000008,
}
```

GET_ATTACHED_VOLUME_INFORMATION

If this flag is enabled, the filter driver will send all the attached volume information to the user mode service.

VOLUME_ATTACHED_NOTIFICATION

If this flag is enabled, you will get the notification when the filter driver attached to a volume.

VOLUME_DETACHED_NOTIFICATION

If this flag is enabled, you will get the notification when the filter driver detached from a volume.

BLOCK_VOLUME_DISMOUNT

If this flag is enabled, it will prevent the attached volumes from being formatted or dismounted.

Comments

EaseFilter Filter Driver SDK Manual

This is the control flag for volume information, enable you to get the notification when the filter driver attached to a volume or detached a volume, or prevent the attached volumes from being formatted or dismounted.

typedef struct **VOLUME_INFO**

```
{
    ULONG      VolumeNameLength;
    WCHAR      VolumeName[MAX_FILE_NAME_LENGTH];
    ULONG      VolumeDosNameLength;
    WCHAR      VolumeDosName[MAX_FILE_NAME_LENGTH];
    ULONG      VolumeFileSystemType;
    ULONG      DeviceCharacteristics;
} VOLUME_INFO, *PVOLUME_INFO;
```

Members

VolumeNameLength

This is the length of the volume name.

VolumeName

The volume name buffer.

VolumeDosNameLength

The length of the volume dos name.

VolumeDosName

The volume dos name buffer.

VolumeFileSystemType

The file system type of the attached volume.

DeviceCharacteristics

The volume attached device's characteristics.

Comments

This is the structure of the volume's information when the filter driver attached to a volume or detached a volume.

typedef enum **ProcessControlFlag**

```
{
    DENY_NEW_PROCESS_CREATION          = 0X00000001,
    PROCESS_CREATION_NOTIFICATION      = 0X00000100,
```

EaseFilter Filter Driver SDK Manual

```
PROCESS_TERMINATION_NOTIFICATION           = 0X00000200,  
PROCESS_HANDLE_OP_NOTIFICATION            = 0X00000400,  
THREAD_CREATION_NOTIFICATION              = 0X00000800,  
THREAD_TERMINATION_NOTIFICATION          = 0X00001000,  
THREAD_HANDLE_OP_NOTIFICATION            = 0X00002000,  
}
```

DENY_NEW_PROCESS_CREATION

If this flag is enabled, it will block the new process creation when the process name matches the process name filter mask. It is especially good to prevent the untrusted process from being launched.

PROCESS_CREATION_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the process creation notification will be sent when the creating new process name matches the process name filter mask.

PROCESS_TERMINATION_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the process termination notification will be sent when the terminating process name matches the process name filter mask.

PROCESS_HANDLE_OP_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the process operation information notification will be sent when a handle for a process is being created or duplicated.

THREAD_CREATION_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the thread creation notification will be sent when the creating new thread's process name matches the process name filter mask.

THREAD_TERMINATION_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the thread termination notification will be

EaseFilter Filter Driver SDK Manual

sent when the terminating thread's process name matches the process name filter mask.

THREAD_HANDLE_OP_NOTIFICATION

If this flag is enabled and was registered to the process filter rule, the thread operation information notification will be sent when a handle for a thread is being created or duplicated.

Comments

This is the control flag for process filter rule, to prevent untrusted process from being launched or track the process operations.

}
```

REG_PRE_DELETE_KEY

Specifies that a thread is attempting to delete a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_SET_VALUE_KEY

EaseFilter Filter Driver SDK Manual

Specifies that a thread is attempting to set a value entry for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_DELETE_VALUE_KEY

Specifies that a thread is attempting to delete a value entry for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_SETINFORMATION_KEY

Specifies that a thread is attempting to set the metadata for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_RENAME_KEY

Specifies that a thread is attempting to rename a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_ENUMERATE_KEY

Specifies that a thread is attempting to enumerate a value entry for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_ENUMERATE_KEY

Specifies that a thread is attempting to enumerate a value entry for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_QUERY_KEY

Specifies that a thread is attempting to read the metadata for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_QUERY_VALUE_KEY

Specifies that a thread is attempting to read a value entry for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_QUERY_MULTIPLE_VALUE_KEY

EaseFilter Filter Driver SDK Manual

Specifies that a thread is attempting to query multiple value entries for a key. This value indicates a pre-notification call to RegistryCallback.

REG_PRE_CREATE_KEY

Specifies that a thread is attempting to create a key. This value indicates a pre-notification call to RegistryCallback.

REG_POST_CREATE_KEY

Specifies that a thread has successfully created a key. This value indicates a post-notification call to RegistryCallback.

REG_PRE_OPEN_KEY

Specifies that a thread is attempting to open an existing key. This value indicates a pre-notification call to RegistryCallback.

REG_POST_OPEN_KEY

Specifies that a thread has successfully opened an existing key. This value indicates a post-notification call to RegistryCallback.

REG_PRE_KEY_HANDLE_CLOSE

Specifies that a thread is attempting to close a key handle. This value indicates a pre-notification call to RegistryCallback.

REG_POST_DELETE_KEY

Specifies that the system has attempted to delete the key. This value indicates a post-notification call to RegistryCallback.

REG_POST_SET_VALUE_KEY

Specifies that the system has attempted to set a value entry for a key. This value indicates a post-notification call to RegistryCallback.

REG_POST_DELETE_VALUE_KEY

Specifies that the system has attempted to delete a value entry for a key. This value indicates a post-notification call to RegistryCallback.

REG_POST_SETINFORMATION_KEY

EaseFilter Filter Driver SDK Manual

Specifies that the system has attempted to set the key's metadata. This value indicates a post-notification call to RegistryCallback.

REG_POST_RENAME_KEY

Specifies that the system has attempted to rename the key. This value indicates a post-notification call to RegistryCallback.

REG_POST_ENUMERATE_KEY

Specifies that the system has attempted to enumerate the subkey of a key. This value indicates a post-notification call to RegistryCallback.

REG_POST_ENUMERATE_VALUE_KEY

Specifies that the system has attempted to enumerate the value entry of a key. This value indicates a post-notification call to RegistryCallback.

REG_POST_QUERY_KEY

Specifies that the system has attempted to query the metadata for a key. This value indicates a post-notification call to RegistryCallback.

REG_POST_QUERY_VALUE_KEY

Specifies that the system has attempted to query a value entry for the key. This value indicates a post-notification call to RegistryCallback.

REG_POST_QUERY_MULTIPLE_VALUE_KEY

Specifies that the system has attempted to query multiple value entries for the key. This value indicates a post-notification call to RegistryCallback.

REG_POST_KEY_HANDLE_CLOSE

Specifies that the system has attempted to close a key handle. This value indicates a post-notification call to RegistryCallback.

REG_PRE_CREATE_KEYEX

EaseFilter Filter Driver SDK Manual

Specifies that a thread is attempting to create a key. This value indicates a pre-notification call to RegistryCallback.

REG_POST_CREATE_KEYEX

Specifies that the system has attempted to create a key. This value indicates a post-notification call to RegistryCallback.

REG_PRE_OPEN_KEYEX

Specifies that a thread is attempting to open an existing key. This value indicates a pre-notification call to RegistryCallback.

REG_POST_OPEN_KEYEX

Specifies that the system has attempted to open an existing key. This value indicates a post-notification call to RegistryCallback.

REG_PRE_FLUSH_KEY

Specifies that a thread is attempting to write a key to disk. This value indicates a pre-notification call to RegistryCallback.

REG_POST_FLUSH_KEY

Specifies that the system has attempted to write a key to disk. This value indicates a post-notification call to RegistryCallback.

REG_PRE_LOAD_KEY

Specifies that a thread is attempting to load a registry hive from a file. This value indicates a pre-notification call to RegistryCallback.

REG_POST_LOAD_KEY

Specifies that the system has attempted to load a registry hive from a file. This value indicates a post-notification call to RegistryCallback.

REG_PRE_UNLOAD_KEY

Specifies that a thread is attempting to unload a registry hive. This value indicates a pre-notification call to RegistryCallback.

REG_POST_UNLOAD_KEY

EaseFilter Filter Driver SDK Manual

Specifies that the system has attempted to unload a registry hive. This value indicates a post-notification call to RegistryCallback.

REG_PRE_QUERY_KEY_SECURITY

Specifies that a thread is attempting to obtain a registry key's security information. This value indicates a pre-notification call to RegistryCallback.

REG_POST_QUERY_KEY_SECURITY

Specifies that a thread has attempted to obtain a registry key's security information. This value indicates a post-notification call to RegistryCallback.

REG_PRE_SET_KEY_SECURITY

Specifies that a thread is attempting to set a registry key's security information. This value indicates a pre-notification call to RegistryCallback.

REG_POST_SET_KEY_SECURITY

Specifies that a thread has attempted to set a registry key's security information. This value indicates a post-notification call to RegistryCallback.

REG_CALLBACK_OBJECT_CONTEXT_CLEANUP

Specifies that the driver has called CmUnRegisterCallback or the driver's RegistryCallback routine has just finished processing a RegNtPreKeyHandleClose class value.

REG_PRE_RESTORE_KEY

Specifies that a thread is attempting to restore a registry key's information. This value indicates a pre-notification call to RegistryCallback.

REG_POST_RESTORE_KEY

Specifies that a thread has attempted to restore a registry key's information. This value indicates a post-notification call to RegistryCallback.

REG_PRE_SAVE_KEY

EaseFilter Filter Driver SDK Manual

Specifies that a thread is attempting to save a registry key's information. This value indicates a pre-notification call to RegistryCallback.

REG_POST_SAVE_KEY

Specifies that a thread has attempted to save a registry key's information. This value indicates a post-notification call to RegistryCallback.

REG_PRE_REPLACE_KEY

Specifies that a thread is attempting to replace a registry key's information. This value indicates a pre-notification call to RegistryCallback.

REG_POST_REPLACE_KEY

Specifies that a thread has attempted to replace a registry key's information. This value indicates a post-notification call to RegistryCallback.

REG_PRE_QUERY_KEYNAME

Specifies that a thread is attempting to obtain the full path of a registry key. Use this value on Windows 10 and later versions of the Windows operating system.

REG_POST_QUERY_KEYNAME

Specifies that a thread has attempted to obtain the full path of a registry key. Use this value on Windows 10 and later versions of the Windows operating system.

MAX_REG_CALLBACK_CLASS

Specifies the maximum value in this enumeration type.

Comments

This is registry callback class, to get the notification of the registry operations.

typedef enum RegControlFlag

```
{  
    REG_ALLOW_OPEN_KEY           = 0X00000001,  
    REG_ALLOW_CREATE_KEY        = 0X00000002,  
}
```

EaseFilter Filter Driver SDK Manual

REG_ALLOW_KEY_RENAME           = 0X00200000,  
REG_MAX_ACCESS_FLAG           = 0xFFFFFFFF,  
  
}
```

REG_ALLOW_OPEN_KEY

If this flag is disabled, it will block the registry key open if the process name matches the filter rule.

REG_ALLOW_CREATE_KEY

If this flag is disabled, it will block the registry key being created if the process name matches the filter rule.

REG_ALLOW_QUERY_KEY

If this flag is disabled, it will block the registry key being queried if the process name matches the filter rule.

REG_ALLOW_RENAME_KEY

If this flag is disabled, it will block the registry key being renamed if the process name matches the filter rule.

REG_ALLOW_DELETE_KEY

EaseFilter Filter Driver SDK Manual

If this flag is disabled, it will block the registry key being deleted if the process name matches the filter rule.

REG_ALLOW_SET_VALUE_KEY_INFORMATION

If this flag is disabled, it will block the setting the value of the registry key if the process name matches the filter rule.

REG_ALLOW_SET_INFORMATION_KEY

If this flag is disabled, it will block the setting the registry key if the process name matches the filter rule.

REG_ALLOW_ENUMERATE_KEY

If this flag is disabled, it will block the registry key being enumerated if the process name matches the filter rule.

REG_ALLOW_QUERY_VALUE_KEY

If this flag is disabled, it will block the value of the registry key being queried if the process name matches the filter rule.

REG_ALLOW_ENUMERATE_VALUE_KEY

If this flag is disabled, it will block the value of the registry key being enumerated if the process name matches the filter rule.

REG_ALLOW_QUERY_MULTIPLE_VALUE_KEY

If this flag is disabled, it will block the querying of multiple values of the registry key if the process name matches the filter rule.

REG_ALLOW_DELETE_VALUE_KEY

If this flag is disabled, it will block the value of the registry key being deleted if the process name matches the filter rule.

REG_ALLOW_QUERY_KEY_SECURITY

EaseFilter Filter Driver SDK Manual

If this flag is disabled, it will block the registry key security being queried if the process name matches the filter rule.

REG_ALLOW_SET_KEY_SECURITY

If this flag is disabled, it will block the registry key security being setted if the process name matches the filter rule.

REG_ALLOW_RESTORE_KEY

If this flag is disabled, it will block the registry key being restored if the process name matches the filter rule.

REG_ALLOW_SAVE_KEY

If this flag is disabled, it will block the registry key being saved if the process name matches the filter rule.

REG_ALLOW_FLUSH_KEY

If this flag is disabled, it will block the registry key security being flushed if the process name matches the filter rule.

REG_ALLOW_LOAD_KEY

If this flag is disabled, it will block the registry key being loaded if the process name matches the filter rule.

REG_ALLOW_UNLOAD_KEY

If this flag is disabled, it will block the registry key being unloaded if the process name matches the filter rule.

REG_ALLOW_KEY_CLOSE

If this flag is disabled, it will block the registry key being closed if the process name matches the filter rule.

REG_ALLOW_KEY_RENAME

If this flag is disabled, it will block the registry key being renamed if the process name matches the filter rule.

REG_MAX_ACCESS_FLAG

Enable the maximum access right for the registry access.

EaseFilter Filter Driver SDK Manual

Comments

This is the control flag for registry filter rule, to track or control the registry operations.

typedef enum FileEventType

```
{
    FILE_WAS_CREATED           = 0x00000020,

Members

EXCLUDE_FILTER_RULE

EXCLUDE_FILTER_RULE is the rule which bypass the files matched the FilterMask. It can't combine to use with the other access flags. If a file matches the exclude filter rule, the filter will bypass this file, you won't get any Io request notification or control. If a file

EaseFilter Filter Driver SDK Manual

matches both the exclude filter rule and monitor rule, the exclude filter rule will be applied.

EXCLUDE_FILE_ACCESS

EXCLUDE_FILE_ACCESS is the flag indicates the filter will deny the access to the files which match the FilterMask.

REPARSE_FILE_OPEN

REPARSE_FILE_OPEN is the rule which reparses the file matched the FilterMask open to the other files which match the ReparseMask.

Example:

Reparse the file open in folder c:\test to another folder c:\reparseFolder"

```
AddFileFilterRule(ALLOW_MAX_RIGHT_ACCESS|REPARSE_FILE_OPEN, L"c:\\test\\*", 1);
```

```
AddReparseFileMaskToFilterRule(L"c:\\test\\*",L"c:\\reparseFolder\\*");
```

HIDE_FILES_IN_DIRECTORY_BROWSING

HIDE_FILES_IN_DIRECTORY_BROWSING is the flag let you hide the files in the managed folder when it matches the mask.

Example:

Hide the files in folder c:\test for process "explorer.exe"

```
AddFileFilterRule(ALLOW_MAX_RIGHT_ACCESS|HIDE_FILES_IN_DIRECTORY_BROWSING, L"c:\\test\\*", 1);
```

```
AddIncludeProcessNameToFilterRule(L"c:\\test\\*",L"explorer.exe");
```

```
AddHiddenFileMaskToFilterRule(L"c:\\test\\*",L"*.*");
```

ENCRYPTION_FILTER_RULE

ENCRYPTION_FILTER_RULE is the flag indicates the filter will encrypt the new created files which match

EaseFilter Filter Driver SDK Manual

the FilterMask. If the other flag were set, this flag is automatically enabled.

ALLOW_OPEN_WITH_ACCESS_SYSTEM_SECURITY

ALLOW_OPEN_WITH_ACCESS_SYSTEM_SECURITY is the flag indicates if you can open the file with the desired access with the ACCESS_SYSTEM_SECURITY set.

ALLOW_OPEN_WITH_READ_ACCESS

ALLOW_OPEN_WITH_READ_ACCESS is the flag indicates if you can open the file with read access.

ALLOW_OPEN_WITH_WRITE_ACCESS

ALLOW_OPEN_WITH_WRITE_ACCESS is the flag indicates if you can open the file with write access.

ALLOW_OPEN_WITH_CREATE_OR_OVERWRITE_ACCESS

ALLOW_OPEN_WITH_CREATE_OR_OVERWRITE_ACCESS is the flag indicates if you can open with create a new file or overwrite the exist file.

ALLOW_OPEN_WITH_DELETE_ACCESS

ALLOW_OPEN_WITH_DELETE_ACCESS is the flag indicates if you can open the file for deletion or rename access.

ALLOW_READ_ACCESS

ALLOW_READ_ACCESS is the flag indicates if you have the permission to read the file.

ALLOW_WRITE_ACCESS

ALLOW_WRITE_ACCESS is the flag indicates if you have the permission to write the file.

ALLOW_QUERY_INFORMATION_ACCESS

ALLOW_QUERY_INFORMATION_ACCESS is the flag indicates if you have the permission to query the file information.

EaseFilter Filter Driver SDK Manual

ALLOW_SET_INFORMATION

ALLOW_SET_INFORMATION is the flag indicates if you have the permission to set the file information.

ALLOW_FILE_RENAME

ALLOW_FILE_RENAME is the flag indicates if you have the permission to rename the file. If the flag ALLOW_SET_INFORMATION is unset, the rename is blocked automatically.

ALLOW_FILE_DELETE

ALLOW_FILE_DELETE is the flag indicates if you have the permission to delete the file. If the flag ALLOW_SET_INFORMATION is unset, the deletion is blocked automatically.

ALLOW_FILE_SIZE_CHANGE

ALLOW_FILE_SIZE_CHANGE is the flag indicates if you have the permission to change the file size. If the flag ALLOW_SET_INFORMATION is unset, the file size change is blocked automatically.

ALLOW_QUERY_SECURITY_ACCESS

ALLOW_QUERY_SECURITY_ACCESS is the flag indicates if you have the permission to query the file security.

ALLOW_SET_SECURITY_ACCESS

ALLOW_SET_SECURITY_ACCESS is the flag indicates if you have the permission to set the file security.

ALLOW_DIRECTORY_LIST_ACCESS

ALLOW_DIRECTORY_LIST_ACCESS is the flag indicates if you have the permission to browse the directory.

ALLOW_FILE_ACCESS_FROM_NETWORK

ALLOW_FILE_ACCESS_FROM_NETWORK is the flag indicates if you have the permission to access the files from the network server.

EaseFilter Filter Driver SDK Manual

ALLOW_NEW_FILE_ENCRYPTION

ALLOW_NEW_FILE_ENCRYPTION is the flag indicates if you allow to encrypt the new created files by the filter driver.

ALLOW_READ_ENCRYPTED_FILES

ALLOW_READ_ENCRYPTED_FILES is the flag indicates if you allow to read encrypted files, if it is disabled, the encrypted data will return to the users.

ALLOW_ALL_SAVE_AS

ALLOW_ALL_SAVE_AS is the flag indicates if the process has the permission to create a new file.

ALLOW_COPY_PROTECTED_FILES_OUT

ALLOW_COPY_PROTECTED_FILES_OUT is the flag indicates if allow the protected files being copy out of the protected folder, if allow_all_save_as is true.

ALLOW_FILE_MEMORY_MAPPED

ALLOW_FILE_MEMORY_MAPPED indicates if the file can be opened with memory mapped, a file execution must be opened with memory mapped.

DISABLE_ENCRYPT_DATA_ON_READ

DISABLE_ENCRYPT_DATA_ON_READ is false, and the encryption is enabled, it can encrypt the data when the application reads the file, it enables you to encrypt your files when you upload or copy out your files to other places.

LEAST_ACCESS_FLAG

LEAST_ACCESS_FLAG indicates the file has the least access right, it can't be set to 0, or it will be excluded by the filter driver.

ALLOW_MAX_RIGHT_ACCESS

EaseFilter Filter Driver SDK Manual

ALLOW_MAX_RIGHT_ACCESS indicates if you have the maximum access right to the file.

Comments

A accessFlag is associated to a filter rule, used to control the access to the files matched the FilterMask.

typedef enum AESFlags

```
{
    Flags_Enabled_Expire_Time           = 0x00000010,
    Flags_Enabled_Check_ProcessName     = 0x00000020,
    Flags_Enabled_Check_UserName        = 0x00000040,
    Flags_Enabled_Check_AccessFlags     = 0x00000080,
    Flags_Enabled_Check_User_Permit     = 0x00000100,
    Flags_AES_Key_Was_Embedded          = 0x00000200,
    Flags_Enabled_Request_IV_And_Key    = 0x00000400,
    Flags_Enabled_Revoke_Access_Control = 0x00000800,
    Flags_Enabled_Check_Computer_Id     = 0x00001000,
    Flags_Enabled_Check_User_Password   = 0x00002000,
};
```

Members

Flags_Enabled_Expire_Time

Flags_Enabled_Expire_Time is the flag which indicates that the filter driver will check if the encrypted file was expired before it can be opened.

Flags_Enabled_Check_ProcessName

Flags_Enabled_Check_ProcessName is the flag which indicates that the filter driver will check if the process has the permission to open the encrypted file.

Flags_Enabled_Check_UserName

Flags_Enabled_Check_UserName is the flag which indicates that the filter driver will check if the user has the permission to open the encrypted file.

Flags_Enabled_Check_AccessFlags

EaseFilter Filter Driver SDK Manual

`Flags_Enabled_Check_AccessFlags` is the flag which indicates that the filter driver will check the access flags if the encrypted file can be opened.

Flags_Enabled_Check_User_Permit

`Flags_Enabled_Check_User_Permit` is the flag which indicates that the filter driver will require the user permission before the encrypted file can be opened.

Flags_AES_KEY_WAS_EMBEDDED

`Flags_AES_KEY_WAS_EMBEDDED` is the flag which indicates that the filter driver will use the embedded AES key to decrypt the file.

Flags_Enabled_Request_IV_And_Key

`Flags_Enabled_Request_IV_And_Key` is the flag which indicates that the filter driver will require encryption key and IV from user mode service to decrypt the file.

Flags_Enabled_Revoke_Access_Control

`Flags_Enabled_Revoke_Access_Control` is the flag which indicates that the filter driver will require the permission from the control server and get the encryption key and IV to decrypt the file.

Flags_Enabled_Check_Computer_Id

`Flags_Enabled_Check_Computer_Id` is the flag which indicates that the filter driver will check if the computer can access the encrypted files.

Flags_Enabled_Check_User_Password

`Flags_Enabled_Check_User_Password` is the flag which indicates that the filter driver will require the user password before the encrypted file can be opened.

Comments

A `AESFlags` is a flag inside the metadata of the encrypted file.

EaseFilter Filter Driver SDK Manual

typedef struct _AES_DATA

```
{
    ULONG           VerificationKey;
    ULONG           AESFlags;
    ULONG           Version;
    UCHAR           IV[16];
    ULONG           EncryptionKeyLength;
    UCHAR           EncryptionKey[32];
    LONGLONG        FileSize;
    ULONG           CryptoType;
    ULONG           PaddingSize;
    ULONG           AESDataSize;
    LONGLONG        FileSizeOnDisk;

    ULONG           Reserve2;
    ULONG           TagDataLength;
    WCHAR           TagData[1];
}
```

Members

EaseTagKey

The verification key of the AES data structure, the value is 0xccb76e80.

AESFlags

The Flags of the encrypted file's meta data, indicates the filter driver what action needs to do for the encrypted file opens.

Version

The version indicates the encryption engine OpenSSL library if it is 16, or use Microsoft CNG library if it is 32.

IV

The 16 bytes initialization vector, is an arbitrary number that can be used along with an encryption key for the file encryption.

EaseFilter Filter Driver SDK Manual

EncryptionKeyLength

The length of the encryption key, it should be 16,24 or 32.

EncryptionKey

The encryption key for the file encryption.

FileSize

The file size was present to the user for the encrypted file, this is file size doesn't include the padding size and the header size.

CryptoType

The crypto type for the encryption, default is 0 which is using AES CTR mode.

PaddingSize

The padding size of the last block if it needs the padding.

AESDataSize

The total size of this structure, this is the size which will be appended to the encrypted file.

FileSizeOnDisk

This is the actual physical file size of the encrypted file, includes the padding size and the header size.

AccessFlags

The file access control flag if the bit *Flags_Enabled_Check_AccessFlags* in the AESFlags flag was enabled.

Reserve1

The reserve data for future use.

Reserve2

The reserve data for future use.

EaseFilter Filter Driver SDK Manual

TagDataLength

The length of the custom data.

TagData

The custom tag data which was added by the user from the encryption API.

Comments

AES_DATA structure is the metadata of the encrypted file which was appended to the end of the file.

Typedef enum FilterStatus

```
{  
    FILTER_MESSAGE_IS_DIRTY           = 0x00000001,  
    FILTER_COMPLETE_PRE_OPERATION     = 0x00000002,  
    FILTER_DATA_BUFFER_IS_UPDATED     = 0x00000004,  
};
```

Members

FILTER_MESSAGE_IS_DIRTY

FILTER_MESSAGE_IS_DIRTY is the flag indicates the reply message was modified and needs to be processed in filter driver. Set this flag if you change the reply message.

FILTER_COMPLETE_PRE_OPERATION

FILTER_COMPLETE_PRE_OPERATION is the flag indicates the filter needs to complete this pre I/O request. Only set this flag with pre operation request when you don't want the request goes down to the file system.

FILTER_DATA_BUFFER_IS_UPDATED

FILTER_DATA_BUFFER_IS_UPDATED is the flag indicates the data buffer of the reply message was updated. The filter will process this data buffer.

Comments

EaseFilter Filter Driver SDK Manual

FilterStatus is the status code which returns to the filter driver, it is for control filter driver. It instructs the filter driver what action needs to be done.

typedef struct *MESSAGE_SEND_DATA*

```
{
    ULONG           MessageId;
    PVOID           FileObject;
    PVOID           FsContext;
    ULONG           MessageType;
    ULONG           ProcessId;
    ULONG           ThreadId;
    LONGLONG        Offset;
    ULONG           Length;
    LONGLONG        FileSize;
    LONGLONG        TransactionTime;
    LONGLONG        CreationTime;
    LONGLONG        LastAccessTime;
    LONGLONG        LastWriteTime;
    ULONG           FileAttributes;
    ULONG           DesiredAccess;
    ULONG           Disposition;
    ULONG           ShareAccess;
    ULONG           CreateOptions;
    ULONG           CreateStatus;
    ULONG           InfoClass;
    ULONG           Status;
    ULONG           FileNameLength;
    WCHAR           FileName[MAX_FILE_NAME_LENGTH];
    ULONG           SidLength;
    UCHAR           Sid[MAX_SID_LENGTH];
    ULONG           DataBufferLength;
    UCHAR           DataBuffer[MAX_MESSAGE_SIZE];
    ULONG           VerificationNumber;
} MESSAGE_SEND_DATA, *PMESSAGE_SEND_DATA;
```

Members

MessageId

This is the sequential number of the transaction.

FileObject

EaseFilter Filter Driver SDK Manual

The FileObject is the pointer to the file object, it is a unique number to every file open.

FsContext

The FsContext is the pointer to the file context, it is unique number to the same file.

MessageType

MessageType is the I/O request type for this transaction.

ProcessId

The ProcessId is the id of the process associated with the thread that originally requested the I/O operation.

ThreadId

The ThreadId is the id of thread which requested the I/O operation.

Offset

The Offset is the read or write offset.

Length

The Length is the length for read or write.

FileSize

The FileSize is the size of the file for this I/O request.

TransactionTime

The transaction time in UTC format of the request.

CreationTime

The creation time in UTC format of the file we are requesting.

LastAccessTime

The last access time in UTC format of the file we are requesting.

LastWriteTime

The last write time in UTC format of the file we are requesting.

FileAttributes

EaseFilter Filter Driver SDK Manual

The file attributes of the file we are requesting.

DesiredAccess

The DesiredAccess is the request access to the file for the Create I/O request, which can be summarized as read, write, both or neither zero. For more information reference the Windows API CreateFile.

Disposition

The disposition is the action to take on a file that exist or does not exist. For more information reference the Windows API CreateFile.

SharedAccess

The SharedAccess is the requested sharing mode of the file which can be read, write, both, delete, all of these, or none. For more information reference the Windows API CreateFile.

CreateOptions

The CreateOptions specifies the options to be applied when creating or opening the file. For more information reference the Windows API CreateFile.

CreateStatus

The CreateStatus is the status after the Create I/O request completed. It could be the one of the following values:

```
FILE_SUPERSEDED = 0x00000000,  
FILE_OPENED = 0x00000001,  
FILE_CREATED = 0x00000002,  
FILE_OVERWRITTEN = 0x00000003,  
FILE_EXISTS = 0x00000004,  
FILE_DOES_NOT_EXIST = 0x00000005,
```

InfoClass

The infoClass is the information class for query/set information I/O request, or directory browsing request. For query/set security request, it is the security information. For more information reference the windows Filter API FltQueryInformationFile, FltQueryDirectoryFile, FltQuerySecurityObject.

Status

EaseFilter Filter Driver SDK Manual

The Status is the I/O status which returns from the file system, indicates if the I/O request succeeded. It is only meaningful to the post I/O requests.

FileNameLength

The file name length in byte of the file we are requesting.

FileName

The file name we are requesting.

SidLength

The length of the security identifier buffer in byte.

Sid

The buffer of the security identifier data.

DataBufferLength

The data buffer length for read, write, security, information, directory I/O requests.

DataBuffer

The The data buffer length for read, write, security, information, directory I/O requests.

VerificationNumber

The verification number to verify the data structure integrity.

Comments

The MESSAGE_SEND_DATA structure is used to transfer the data from kernel to the user mode application. It includes all the information needed for the user.

typedef struct _PROCESS_INFO

```
{  
    ULONG           MessageId;  
    PVOID           Reserve1;  
    PVOID           Reserve2;  
    ULONG           MessageType;  
    LONGLONG        TransactionTime;  
    ULONG           ProcessId;  
    ULONG           ThreadId;  
    ULONG           ParentProcessId;  
}
```

EaseFilter Filter Driver SDK Manual

```
    ULONG           CreatingProcessId;
    ULONG           CreatingThreadId;
    ULONG           DesiredAccess;
    ULONG           Operation;
    BOOL            FileOpenNameAvailable;
    ULONG           SidLength;
    UCHAR           Sid[MAX_SID_LENGTH];
    ULONG           FileNameLength;
    WCHAR           FileName[MAX_FILE_NAME_LENGTH];
    ULONG           CommandLineLength;
    WCHAR           CommandLine[MAX_FILE_NAME_LENGTH];
    ULONG           Status;
    ULONG           VerificationNumber;

} PROCESS_INFO, *PPROCESS_INFO;
```

Members

MessageId

This is the sequential number of the transaction.

Reserve1

The reserve data field1.

Reserve2

The reserve data field2.

MessageType

MessageType is the process message type which is the filter command, reference filter command enumeration.

TransactionTime

The transaction time in UTC format of the request.

ProcessId

The ProcessId is the id of the current process associated with the thread that originally requested the process operation.

ThreadId

The thread Id of the current operation thread.

ParentProcessId

The process Id of the parent process for the new process. Note that the parent process is not

EaseFilter Filter Driver SDK Manual

necessarily the same process as the process that created the new process.

CreatingProcessId

The process Id of the process that created new process.

CreatingThreadId

The thread Id of the thread that created the new process.

DesiredAccess

An ACCESS_MASK value that specifies the access rights to grant for the handle.

Operation

The type of handle operation, this member might be one of the following values:OB_OPERATION_HANDLE_CREATE, OB_OPERATION_HANDLE_DUPLICATE.

FileOpenNameAvailable

A boolean value that specifies whether the ImageFilename member contains the exact file name that is used to open the process executable file.

SidLength

The length of the security identifier buffer in byte.

Sid

The buffer of the security identifier data.

ImageFileNameLength

The image file name length in byte of the file name that is used to open the process executable file.

ImageFileName

The file name that is used to open the process executable file.

CommandLineLength

The length in byte of the command line.

CommandLine

The process executable file and command line.

Status

EaseFilter Filter Driver SDK Manual

The Status is the I/O status which returns from the file system, indicates if the I/O request succeeded.

VerificationNumber

The verification number to verify the data structure integrity.

Comments

Replace MESSAGE_SEND_DATA structure with this one when process filter driver sends the process operation callback notification, is used to transfer the data from kernel to the user mode application.

typedef struct MESSAGE_REPLY_DATA

```
{
    ULONG          MessageId;
    ULONG          MessageType;
    ULONG          ReturnStatus;
    ULONG          FilterStatus;
    union
    {
        Struct{
            ULONG          DataBufferLength;
            UCHAR          DataBuffer[MAX_MESSAGE_SIZE];
        }Data;

        Struct{
            ULONG          AESDataLength;
            UCHAR          IV[16];
            ULONG          EncryptionKeyLength;
            UCHAR          EncryptionKey[1];
        }AESData;

        Struct{
            ULONG          UserNameLength;
            UCHAR          UserName[1];
        }UserInfo;

        Struct{
            ULONG          FileNameLength;
            UCHAR          FileName[1];
        }FileInfo;
    }ReplyData
}
```

EaseFilter Filter Driver SDK Manual

```
} MESSAGE_REPLY_DATA, *PMESSAGE_REPLY_DATA;
```

Members

MessageId

This is the sequential number of the transaction.

MessageType

MessageType is the I/O request type for this transaction. Reference MessageType enum type.

ReturnStatus

The ReturnStatus is the I/O status which returns to filter driver, and filter will return this status to the user application for the request.

FilterStatus

The FilterStatus is the status code which returns to the filter driver, it instructs the filter what process needs to be done. For more information reference the FilterStatus enum.

DataBufferLength

The data buffer length which returns to the filter driver.

DataBuffer

The data buffer which returns to the filter driver.

AESDataLength

The total length of the AESData.

IV

The 16 bytes initialization vector returns to filter driver.

EncryptionKeyLength

The length of the encryption key.

EncryptionKey

The encryption key returns to the filter driver.

UserNameLength

The length of the user name.

EaseFilter Filter Driver SDK Manual

UserName

The user name buffer.

FileNameLength

The length of the file name.

FileName

The file name buffer.

Comments

MESSAGE_REPLY_DATA is only for control filter, when it needs to change the data or status of the I/O request. To update the reply data buffer, you must understand the format of the buffer, incorrect data could cause your system unfunctional, even crash.

Types

typedef BOOL (__stdcall *Proto_Message_Callback)(

```
IN      PMESSAGE_SEND_DATA  pSendMessage,  
IN OUT PMESSAGE_REPLY_DATA pReplyMessage)
```

Comments

This is the proto type of the message callback function. The function will be called when the registered I/O requests match the filter rule. The second parameter "pReplyMessage" is always NULL for the file system monitor filter.

typedef VOID (__stdcall *Proto_Disconnect_Callback)()

Comments

This is the proto type of disconnect function. The function will be called when the connection to the filter is disconnected.

Exported API

BOOL

EaseFilter Filter Driver SDK Manual

InstallDriver()

Return Value

Return true if it succeeds, else return false.

Comments

Install the EaseFilter driver to the system. To install the driver you need the administrator permission.

BOOL

UnInstallDriver()

Return Value

Return true if it succeeds, else return false.

Comments

UnInstall the EaseFilter driver from the system. To UnInstall the driver you need the administrator permission.

BOOL

SetRegistrationKey(

IN WCHAR RegisterKey)*

Parameters

RegisterKey

Your register key.

Return Value

Return true if it succeeds, else return false.

Comments

You have to set the registration key before you can start the filter.

BOOL

EaseFilter Filter Driver SDK Manual

RegisterMessageCallback(

ULONG ThreadCount,
Proto_Message_Callback MessageCallback,
Proto_Disconnect_Callback DisconnectCallback)

Parameters

ThreadCount

The number of threads used for connection to the filter.

MessageCallback

The message callback function for the registered I/O requests.

DisconnectCallback

The disconnect callback function when the connection is disconnected.

Return Value

Return true if it succeeds, else return false.

Comments

RegisterMessageCallback is the first API you need to call, it is the API start the filter and create the connection to the filter.

VOID

Disconnect()

Comments

Disconnect is the API when you want to stop filter and filter connection.

BOOL

GetLastErrorMessage(WCHAR* Buffer, PULONG BufferLength)

Parameters

Buffer

EaseFilter Filter Driver SDK Manual

This the pointer of the buffer to receive the last error message.

BufferLength

The length of the buffer.

Return Value

Return true if it succeeds, else return false if the buffer length is not big enough to contain the message, and the BufferLength is set with the right size needed.

Comments

This API is called right after if the other API is failed. It will return the error message.

BOOL

ResetConfigData();

Return Value

Return true if it succeeds, else return false.

Comments

ResetConfigData is the API reset all the configuration of the filter, it will clear up all the setting includes the filter rules.

BOOL

SetFilterType(ULONG FilterType)

Parameters

FilterType

The type of the filter you want to set. There are FILE_SYSTEM_MONITOR filter and FILE_SYSTEM_CONTROL filter.

Return Value

Return true if it succeeds, else return false.

Comments

The default filter type is file system monitor filter.

EaseFilter Filter Driver SDK Manual

BOOL

SetConnectionTimeout(ULONG TimeOutInSeconds)

Parameters

TimeOutInSeconds

The value of the filter wait time out.

Return Value

Return true if it succeeds, else return false.

Comments

This is the maximum time for the filter driver wait for the response from user mode, the user mode application should return as fast as possible, or it will block the system requests. Set it bigger if your application needs to process with more time.

BOOL

SetVolumeControlFlag(ULONG VolumeControlFlag)

Parameters

VolumeControlFlag

The value of the volume control flag.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to register the notification when the filter driver attached the volume or detached the volume. You also can prevent the attached volumes from being formatted or dismounted.

BOOL

AddFileFilterRule(

IN *ULONG* *AccessFlag,*
IN *WCHAR** *FilterMask*

EaseFilter Filter Driver SDK Manual

)

Parameters

AccessFlag

The AccessFlag of this filter rule.

FilterMask

The FilterMask set the target folder or files. The mask is dos format, it can include wild character '*' or '?'. For example:

```
C:\test\*txt
```

The filter only monitor the files end with 'txt' in the folder c:\test.

Return Value

Return true if it succeeds, else return false.

Comments

AddFileFilterRule is the API to setup the filter rule, You can set up multiple filter rules, the FilterMask must be different, if the FilterMask is the same, it will overwrite the previous one.

BOOL

RegisterEventTypeToFilterRule(

```
IN    WCHAR* FilterMask,  
IN    ULONG  EventType
```

)

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule.

EventType

The event types were registered to the filter rule, were used to monitor the file events.

Comments

If you want to monitor the file events for the filter rule, this is the API to register the event types.

EaseFilter Filter Driver SDK Manual

BOOL

RegisterMonitorToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    ULONG RegisterIO  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule.

RegisterIO

The IOs were registered to the filter rule, only post-IOs can be registered, it was used to monitor the file IOs, when it was triggered, filter driver will send the notification to the user.

Comments

If you want to get the notification of the file IOs for the filter rule, this is the API to register the IOs which you are interested.

BOOL

RegisterControlToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    ULONG RegisterIO  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule.

RegisterIO

The IOs were registered to the filter rule, were used to control the file IOs, when it was triggered, filter driver will send the notification to the user, block and wait for the response, it can control the IOs data and status based on the return result.

Comments

EaseFilter Filter Driver SDK Manual

If you want to control the file requests, this is the API to register the IOs which you are interested.

BOOL

AddRegisterIOFilterToFilterRule(

```
    IN    WCHAR*  FilterMask,  
    IN    ULONG   FilterByDesiredAccess,  
    IN    ULONG   FilterByDisposition,  
    IN    ULONG   FilterByCreateOptions  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule.

FilterByDesiredAccess

Filter the register IO option with file opens DesiredAccess.

FilterByDisposition

Filter the register IO option with file opens Disposition.

FilterByCreateOptions

Filter the register IO option with file opens CreateOptions.

Comments

Filter the callback IOs by the file open options if the callback IOs were registered.

BOOL

AddEncryptionKeyToFilterRule(

```
    IN    WCHAR*  FilterMask,  
    IN    ULONG   EncryptionKeyLength,  
    IN    UCHAR*  EncryptionKey  
)
```

Parameters

FilterMask

EaseFilter Filter Driver SDK Manual

The FilterMask which was set in API AddFileFilterRule.

EncryptionKeyLength

The length of the encryption key.

EncryptionKey

The encryption key for the filter rule.

Return Value

Return true if it succeeds, else return false.

Comments

If the encryption was enabled in the access flag in the API AddFileFilterRule, this is the API to add the encryption key for the filter rule, every file will use an unique iv.

BOOL

AddEncryptionKeyAndIVToFilterRule(

```
    IN   WCHAR* FilterMask,  
    IN   ULONG  EncryptionKeyLength,  
    IN   UCHAR* EncryptionKey,  
    IN   ULONG  IVLength,  
    IN   UCHAR* IV  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule.

EncryptionKeyLength

The length of the encryption key.

EncryptionKey

The encryption key for the filter rule.

IVLength

The length of the encryption iv.

IV

The encryption iv for the filter rule.

Return Value

Return true if it succeeds, else return false.

EaseFilter Filter Driver SDK Manual

Comments

If the encryption was enabled in the access flag in the API `AddFileFilterRule`, this is the API to add the encryption key and iv for the filter rule, all files in this filter rule will use the same key and iv.

BOOL

AddReparseFileMaskToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* ReparseFilterMask  
)
```

Parameters

FilterMask

The FilterMask which was set in API `AddFileFilterRule` .

ReparseFilterMask

The reparse folder mask, it can include the wild character, but it must match the wild character in FilterMask.

For example:

```
FilterMask = c:\test\*txt  
ReparseFilterMask = d:\reparse\*doc
```

If you open file `c:\test\MyTest.txt`, it will reparse to the file `d:\reparse\MyTest.doc`.

Return Value

Return true if it succeeds, else return false.

Comments

If the `REPARSE_FILE_OPEN` was enabled in the access flag in the API `AddFileFilterRule` , this is the API to add the reparse filter mask for the filter rule.

BOOL

EaseFilter Filter Driver SDK Manual

AddHiddenFileMaskToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* HiddenFileFilterMask  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule .

HiddenFileFilterMask

The hidden file filter mask for the files to be hidden.

For example:

```
FilterMask = c:\hideFilesTest\\*  
HiddenFileFilterMask = *.doc
```

If you open folder c:\hideFilesTest, all the files with extension .doc won't show up in the folder.

Return Value

Return true if it succeeds, else return false.

Comments

If the `HIDE_FILES_IN_DIRECTORY_BROWSING` was enabled in the access flag in the API `AddFileFilterRule` , this is the API to add the hidden filter mask for the filter rule.

BOOL

AddExcludeFileMaskToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* ExcludeFileFilterMask  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule .

ExcludeFileFilterMask

The file filter mask to be excluded.

EaseFilter Filter Driver SDK Manual

For example:

```
FilterMask = *.txt  
ExcludeFileFilterMask = c:\windows\*
```

The filter driver target file is all the files with extension .txt except the files in folder c:\windows and its subfolders.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the exclude file filter mask for the filter rule which was set in `AddFileFilterRule` .

BOOL

AddIncludeProcessIdToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    ULONG IncludeProcessId  
)
```

Parameters

FilterMask

The FilterMask which was set in API `AddFileFilterRule` .

IncludeProcessId

The process Id to be included by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the include process Id for the filter rule which was set in `AddFileFilterRule` ,only the files opened by the processes in the included process Ids and process names will be monitored by the filter driver.

BOOL

EaseFilter Filter Driver SDK Manual

AddExcludeProcessIdToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    ULONG ExcludeProcessId  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule .

ExcludeProcessId

The process Id to be excluded by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the exclude process Id for the filter rule which was set in AddFileFilterRule , all the files were opened by the processes in the excluded process Ids and process names won't be monitored by the filter driver.

BOOL

AddIncludeProcessNameToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* IncludeProcessName  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule .

IncludeProcessName

The process name to be included by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

EaseFilter Filter Driver SDK Manual

This is the API to add the include process name for the filter rule which was set in `AddFileFilterRule` , only the files opened by the processes in the included process Ids and process names will be monitored by the filter driver.

BOOL

AddExcludeProcessNameToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* ExcludeProcessName  
)
```

Parameters

FilterMask

The FilterMask which was set in API `AddFileFilterRule` .

ExcludeProcessName

The process name to be excluded by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the exclude process name for the filter rule which was set in `AddFileFilterRule` , all the files were opened by the processes in the excluded process Ids and process names won't be monitored by the filter driver.

BOOL

AddIncludeUserNameToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* IncludeUserName  
)
```

Parameters

FilterMask

The FilterMask which was set in API `AddFileFilterRule` .

IncludeUserName

EaseFilter Filter Driver SDK Manual

The user name to be included by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the include user name for the filter rule which was set in `AddFileFilterRule` ,only the files were opened by the users in the included user names will be monitored by the filter driver.

BOOL

AddExcludeUserNameToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* ExcludeUserName  
)
```

Parameters

FilterMask

The FilterMask which was set in API `AddFileFilterRule` .

ExcludeUserName

The process name to be excluded by filter driver.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the exclude user name for the filter rule which was set in `AddFileFilterRule` , all the files were opened by the users in the excluded user names won't be monitored by the filter driver.

BOOL

AddProcessRightsToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    WCHAR* ProcessName,  
    IN    ULONG  AccessFlag  
)
```

EaseFilter Filter Driver SDK Manual

Parameters

FilterMask

The FilterMask which was set in API
AddFileFilterRule .

ProcessName

The process name to be set access rights.

AccessFlag

The access rights for the process.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the access flags to the specific process, when the process accesses the files, it needs to check permission from access flags first to allow or deny the file access.

BOOL

AddUserRightsToFilterRule(

```
    IN   WCHAR* FilterMask,  
    IN   WCHAR* UserName,  
    IN   ULONG  AccessFlag  
)
```

Parameters

FilterMask

The FilterMask which was set in API
AddFileFilterRule .

UserName

The user name to be set access rights.

AccessFlag

The access rights for the user.

Return Value

Return true if it succeeds, else return false.

Comments

EaseFilter Filter Driver SDK Manual

This is the API to add the access flags to the specific user, when the user accesses the files, it needs to check permission from access flags first to allow or deny the file access.

BOOL

AddBooleanConfigToFilterRule(

```
    IN    WCHAR* FilterMask,  
    IN    ULONG BooleanConfig  
)
```

Parameters

FilterMask

The FilterMask which was set in API AddFileFilterRule .

Booleanconfig

The boolean config setting.

Return Value

Return true if it succeeds, else return false.

Comments

This is the API to add the boolean config setting for the filter rule which was set in AddFileFilterRule , please reference the BooleanConfig enumeration.

BOOL

RemoveFilterRule(WCHAR* FilterMask);

Parameters

FilterMask

The FilterMask associated to the filter rule.

Return Value

Return true if it succeeds, else return false.

Comments

EaseFilter Filter Driver SDK Manual

You can remove the filter rule which was set by AddFileFilterRule API.

BOOL

AddIncludedProcessId(ULONG ProcessId)

Parameters

ProcessId

The process Id you want to be included by filter.

Return Value

Return true if it succeeds, else return false.

Comments

This API let the filter driver only intercept the I/O for the included processes, discard all other I/O from other processes, you can add multiple process Id.

BOOL

RemoveExcludeProcessId(ULONG ProcessId)

Parameters

ProcessId

The process Id you want to remove which set by AddIncludedProcessId API.

Return Value

Return true if it succeeds, else return false.

Comments

This API removes the included process Id from filter.

BOOL

AddExcludedProcessId(ULONG ProcessId)

Parameters

EaseFilter Filter Driver SDK Manual

ProcessId

The process Id you want to be excluded by filter.

Return Value

Return true if it succeeds, else return false.

Comments

This API let you can bypass the filter for specific processes, you can add multiple process Id.

BOOL

RemoveExcludeProcessId(ULONG ProcessId)

Parameters

ProcessId

The process Id you want to remove which set by AddExcludedProcessId API.

Return Value

Return true if it succeeds, else return false.

Comments

This API removes the excluded process Id from filter.

BOOL

AddRegistryFilterRule(

```
    IN    ULONG    ProcessNameLength
    IN    WCHAR*   ProcessName,
    IN    ULONG    ProcessId,
    IN    ULONG    UserNameLength,
    IN    WCHAR*   UserNameFilterMask,
    IN    ULONG    KeyNameLength,
    IN    WCHAR*   KeyNameFilterMask,
    IN    ULONG    AccessFlag,
    IN    ULONGLONG RegCallbackClass,
    IN    BOOL     IsExcludeFilter
```

)

Parameters

ProcessNameLength

EaseFilter Filter Driver SDK Manual

The length of the process name string in bytes.

ProcessName

The process name to be filtered, use '*' to include all processes.

ProcessId

If the process Id is not 0, then filter with the process Id instead of the process name.

UserNameLength

The length of the user name string in bytes.

UserNameFilterMask

The user name to be filtered, use '*' to include all users.

KeyNameLength

The length of the process name string in bytes.

KeyNameFilterMask

The register key name to be filtered, use '*' to include all the keys.

AccessFlag

The access control flag for the registry filter rule.

RegCallbackClass

Register the callback class for the registry filter rule.

IsExcludeFilter

The flag indicates if the filter rule exclude filter rule, if it is true, the filter driver will skip all the registry operation for this filter rule.

Comments

This is the API to add the registry filter rule, filter by process name.

BOOL

AddRegistryFilterRuleByName(

IN *ULONG* *ProcessNameLength*
IN *WCHAR** *ProcessName,*

EaseFilter Filter Driver SDK Manual

```
    IN    ULONG      AccessFlag,  
    IN    ULONGLONG RegCallbackClass,  
    IN    BOOL       IsExcludeFilter  
)
```

Parameters

ProcessNameLength

The length of the process name string in bytes.

ProcessName

The process name to be filtered, use '*' to include all processes.

AccessFlag

The access control flag for the registry filter rule.

RegCallbackClass

Register the callback class for the registry filter rule.

IsExcludeFilter

The flag indicates if the filter rule exclude filter rule, if it is true, the filter driver will skip all the registry operation for this filter rule.

Comments

This is the API to add the registry filter rule, filter by process name.

BOOL

AddRegistryFilterRuleByProcessId(

```
    IN    ULONG      ProcessId  
    IN    ULONG      AccessFlag,  
    IN    ULONGLONG RegCallbackClass,  
    IN    BOOL       IsExcludeFilter  
)
```

Parameters

ProcessId

The process Id of the process which will be managed by registry filter driver.

EaseFilter Filter Driver SDK Manual

AccessFlag

The access control flag for the registry filter rule.

RegCallbackClass

Register the callback class for the registry filter rule.

IsExcludeFilter

The flag indicates if the filter rule exclude filter rule, if it is true, the filter driver will skip all the registry operation for this filter rule.

Comments

This is the API to add the registry filter rule, filter by process Id.

BOOL

RemoveRegistryFilterRuleByProcessId(

IN ULONG ProcessId

)

Parameters

ProcessId

The process Id of the process which will be managed by registry filter driver.

Comments

This is the API to remove the registry filter rule, filter by process Id.

BOOL

RemoveRegistryFilterRuleByName(

IN ULONG ProcessNameLength

IN WCHAR ProcessName*

)

Parameters

ProcessNameLength

The length of the process name string in bytes.

EaseFilter Filter Driver SDK Manual

ProcessName

The process name to be filtered.

Comments

This is the API to remove the registry filter rule, filter by process name.

BOOL

AddProceeFilterRule(

```
    IN    ULONG    ProcessNameMaskLength,  
    IN    WCHAR*   ProcessNameMask,  
    IN    ULONG    ControlFlag  
)
```

Parameters

ProcessNameLength

The length of the process name mask string in bytes.

ProcessName

The process name mask to be filtered.

ControlFlag

The control flag for the process, reference the ProcessControlFlag enumeration.

Comments

This is the API to add the process filter rule, to prevent the process from being launched, or register the callback notification of the process operation.

BOOL

RemoveProceeFilterEntry(

```
    IN    ULONG    ProcessNameMaskLength,  
    IN    WCHAR*   ProcessNameMask  
)
```

Parameters

ProcessNameLength

The length of the process name mask string in bytes.

EaseFilter Filter Driver SDK Manual

ProcessName

The process name mask to be filtered.

Comments

This is the API to remove the process filter rule.

BOOL

AddFileControlToProcessByName(

```
    IN    ULONG    ProcessNameMaskLength,  
    IN    WCHAR*   ProcessNameMask,  
    IN    ULONG    FileNameNameMaskLength,  
    IN    WCHAR*   FileNameMask,  
    IN    ULONG    AccessFlag  
)
```

Parameters

ProcessNameLength

The length of the process name mask string in bytes.

ProcessName

The process name mask to be filtered.

FileNameMaskLength

The length of the file name mask string in bytes.

FileNameMask

The file name mask to be filtered.

AccessFlag

The file access flag which control the process file access rights.

MonitorIO

Register the callback notification of the monitor IO.

ControlIO

Register the callback notification of the control IO.

Comments

EaseFilter Filter Driver SDK Manual

This is the API to add the file access rights of the specific files to the specific processes.

BOOL

AddFilterCallbackIOToProcessByName(

```
    IN    ULONG    ProcessNameMaskLength,  
    IN    WCHAR*   ProcessNameMask,  
    IN    ULONG    FileNameNameMaskLength,  
    IN    WCHAR*   FileNameMask,  
    IN    ULONG    MonitorIO,  
    IN    ULONG    ControlIO,  
    IN    ULONG    FilterByDesiredAccess,  
    IN    ULONG    FilterByDisposition,  
    IN    ULONG    FilterByCreateOptions
```

)

Parameters

ProcessNameLength

The length of the process name mask string in bytes.

ProcessName

The process name mask to be filtered.

FileNameMaskLength

The length of the file name mask string in bytes.

FileNameMask

The file name mask to be filtered.

MonitorIO

Register the callback notification of the monitor IO.

ControlIO

Register the callback notification of the control IO.

FilterByDesiredAccess

Filter the register IO option with file opens
DesiredAccess.

FilterByDisposition

Filter the register IO option with file opens
Disposition.

EaseFilter Filter Driver SDK Manual

FilterByCreateOptions

Filter the register IO option with file opens CreateOptions.

Comments

Register the callback IOs for the process, filter the callback IOs by the file open options if they are not zero.

BOOL

RemoveFileControlFromProcessByName(

```
    IN    ULONG    ProcessNameMaskLength,  
    IN    WCHAR*   ProcessNameMask,  
    IN    ULONG    FileNameNameMaskLength,  
    IN    WCHAR*   FileNameMask  
)
```

Parameters

ProcessNameLength

The length of the process name mask string in bytes.

ProcessName

The process name mask to be filtered.

FileNameMaskLength

The length of the file name mask string in bytes.

FileNameMask

The file name mask to be filtered.

Comments

This is the API to remove the file access rights of the specific files to the specific processes if it was set.

BOOL

AddFileControlToProcessById(

```
    IN    ULONG    ProcessId,  
    IN    ULONG    FileNameNameMaskLength,  
    IN    WCHAR*   FileNameMask,  
    IN    ULONG    AccessFlag  
)
```

EaseFilter Filter Driver SDK Manual

Parameters

ProcessId

The process Id of the process which will be added file access rights.

ProcessName

The process name mask to be filtered.

FileNameMaskLength

The length of the file name mask string in bytes.

FileNameMask

The file name mask to be filtered.

AccessFlag

The file access flag which control the process file access rights.

Comments

This is the API to add the file access rights of the specific files to the specific process.

BOOL

RemoveFileControlFromProcessById(

```
    IN    ULONG    ProcessId,  
    IN    ULONG    FileNameNameMaskLength,  
    IN    WCHAR*   FileNameMask  
)
```

Parameters

ProcessId

The process Id of the process which will be removed file access rights.

FileNameMaskLength

The length of the file name mask string in bytes.

FileNameMask

The file name mask to be filtered.

Comments

EaseFilter Filter Driver SDK Manual

This is the API to remove the file access rights of the specific files to the specific process if it was set.

BOOL

AddProtectedProcessId(ULONG ProcessId)

Parameters

ProcessId

The process Id you want to be protected by filter.

Return Value

Return true if it succeeds, else return false.

Comments

This API can prevent the process being terminated, you can add multiple process Id, this API is supported in OS vista or later versions.

BOOL

RemoveProtectedProcessId(ULONG ProcessId)

Parameters

ProcessId

The process Id you want to remove which set by *AddProtectedProcessId* API.

Return Value

Return true if it succeeds, else return false.

Comments

This API removes the protected procss Id.

BOOL

RegisterIoRequest(ULONG RequestRegistration)

Parameters

RequestRegistration

EaseFilter Filter Driver SDK Manual

The RequestRegistration is the bit combination of the request type.

Return Value

Return true if it succeeds, else return false.

Comments

Register the I/O requests which you want to monitor. For File_SYSTEM_MONITOR filter, only post I/O requests registration are affected, since it only can get notification after the request was completed by file system.

For FILE_SYSTEM_CONTROL filter you can register both pre and post requests. If you want to deny, cancel or return with your own data instead of going down to the file system, you need to register the pre request.

For some post I/O requests, you can't cancel or deny it, for example Create, Set information, Set security, Write requests.

BOOL

GetFileHandleInFilter(WCHAR FileName, ULONG DesiredAccess, Handle* FileHandle);*

Parameters

FileName

The full path of the file which you want to open.

DesiredAccess

The requested access to the file or device, which can be summarized as read, write, both or neither zero).

FileHandle

The pointer to the file handle which will receive the file handle after the file was opened.

Return Value

Return true if it succeeds, else return false.

Comments

EaseFilter Filter Driver SDK Manual

Use this API to open the file, it will bypass the filter, avoid reentrant issue. It also will bypass the security check. Close the handle with CloseHandle win32 API.

BOOL

AESEncryptFile(

```
IN   WCHAR* FileName,  
IN   ULONG  KeyLength,  
IN   UCHAR* Key,  
IN   ULONG  IVLength,  
IN   UCHAR* IV,  
IN   BOOL   AddAESData )
```

Parameters

FileName

The file name to be encrypted.

KeyLength

The encryption key length, it has to be 16(128bits), 24(192bits) or 32(256bits).

Key

The encryption key, it is an unsigned char array with KeyLength size.

IVLength

The initial vector length, if it is 0, the system will allocate a unique IV for the file.

IV

The initial vector, when IVLength is 0, it sets to NULL.

AddAESData

If it is true, it will add the AESData structure to the encrypted file, then the encryption filter driver can recognize this encrypted file.

Return Value

Return true if it succeeds, else return false.

Comments

EaseFilter Filter Driver SDK Manual

`AESEncryptFile` is the API to encrypt file file with AES encryption cryptographic algorithm.

BOOL

AESEncryptFileWithTag(

```
IN   WCHAR* FileName,  
IN   ULONG  KeyLength,  
IN   UCHAR* Key,  
IN   ULONG  IVLength,  
IN   UCHAR* IV,  
IN   ULONG  TagDataLength,  
IN   UCHAR* TagData )
```

Parameters

FileName

The file name to be encrypted.

KeyLength

The encryption key length, it has to be 16(128bits), 24(192bits) or 32(256bits).

Key

The encryption key, it is an unsigned char array with KeyLength size.

IVLength

The initial vector length, if it is 0, the system will allocate a unique IV for the file.

IV

The initial vector, when IVLength is 0, it sets to NULL.

TagDataLength

The length of the tag data.

TagData

The custom tag data which was added to the `AESData` structure in the encrypted file header, the user can get this custom data when the filter requests the encryption iv and key.

Return Value

Return true if it succeeds, else return false.

EaseFilter Filter Driver SDK Manual

Comments

AESEncryptFile is the API to encrypt file file with AES encryption cryptographic algorithm.

BOOL

AESEncryptFileToFile(

```
IN   WCHAR* SourceFileName,  
IN   WCHAR* DestFileName,  
IN   ULONG  KeyLength,  
IN   UCHAR* Key,  
IN   ULONG  IVLength,  
IN   UCHAR* IV,  
IN   BOOL   AddAESData )
```

Parameters

SourceFileName

The source file name to be encrypted.

DestFileName

The target file name was encrypted.

KeyLength

The encryption key length, it has to be 16(128bits), 24(192bits) or 32(256bits).

Key

The encryption key, it is an unsigned char array with KeyLength size.

IVLength

The initial vector length, if it is 0, the system will allocate a unique IV for the file.

IV

The initial vector, when IVLength is 0, it sets to NULL.

AddAESData

If it is true, it will add the AESData structure to the encrypted file, then the encryption filter driver can recognize this encrypted file.

EaseFilter Filter Driver SDK Manual

Return Value

Return true if it succeeds, else return false.

Comments

AESEncryptFileToFile is the API to encrypt file file with AES encryption cryptographic algorithm.

BOOL

AESEncryptFileToFileWithTag(

```
IN    WCHAR* SourceFileName,  
IN    WCHAR* DestFileName,  
IN    ULONG   KeyLength,  
IN    UCHAR* Key,  
IN    ULONG   IVLength,  
IN    UCHAR* IV,  
IN    ULONG   TagDataLength,  
IN    UCHAR* TagData )
```

Parameters

SourceFileName

The source file name to be encrypted.

DestFileName

The target file name was encrypted.

KeyLength

The encryption key length, it has to be 16(128bits), 24(192bits) or 32(256bits).

Key

The encryption key, it is an unsigned char array with KeyLength size.

IVLength

The initial vector length, if it is 0, the system will allocate an unique IV for the file.

IV

The initial vector, when IVLength is 0, it sets to NULL.

TagDataLength

EaseFilter Filter Driver SDK Manual

The the length of the tag data.

TagData

The custom tag data which was added to the AESData structure in the encrypted file header, the user can get this custom data when the filter request the encryption iv and key.

Return Value

Return true if it succeeds, else return false.

Comments

AESEncryptFileToFile is the API to encrypt file file with AES encryption cryptographic algorithm.

BOOL

AESDecryptFile(

```
IN    WCHAR* FileName,  
IN    ULONG  KeyLength,  
IN    UCHAR* Key,  
IN    ULONG  IVLength,  
IN    UCHAR* IV )
```

Parameters

FileName

The file name to be decrypted.

KeyLength

The encryption key length, it has to be 16(128bits), 24(192bits) or 32(256bits).

Key

The encryption key, it is an unsigned char array with KeyLength size.

IVLength

The initial vector length, if the encrypted file already has IVTag, it will use the IV tag instead of the pass in IV, if the encrypted file doesn't set the IV tag, then the IVLength can't be 0, and IV can't be NULL.

IV

EaseFilter Filter Driver SDK Manual

The initial vector,when the encrypted file doesn't set IV tag, the IV can't be NULL, or it can be NULL.

Return Value

Return true if it succeeds, else return false.

Comments

AESDecryptFile is the API to decrypt file file with AES encryption cryptographic algorithm.

BOOL

AESDecryptFileToFile(

```
IN   WCHAR* SourceFileName,  
IN   WCHAR* DestFileName,  
IN   ULONG  KeyLength,  
IN   UCHAR* Key,  
IN   ULONG  IVLength,  
IN   UCHAR* IV )
```

Parameters

SourceFileName

The encrypted file name.

DestFileName

The target file name was decrypted.

KeyLength

The encryption key length,it has to be 16(128bits),24(192bits) or 32(256bits).

Key

The encryption key,it is an unsigned char array with KeyLength size.

IVLength

The initial vector length,if the encrypted file already has IVTag,it will use the IV tag instead of the pass in IV, if the encrypted file doesn't set the IV tag,then the IVLength can't be 0, and IV can't be NULL.

IV

EaseFilter Filter Driver SDK Manual

The initial vector, when the encrypted file doesn't set IV tag, the IV can't be NULL, or it can be NULL.

Return Value

Return true if it succeeds, else return false.

Comments

AESDecryptFileToFile is the API to decrypt file file with AES encryption cryptographic algorithm.

BOOL

GetAESHeader(

```
IN    WCHAR*  FileName,  
IN    PULONG  HeaderSize,  
IN    UCHAR*  Header )
```

Parameters

FileName

The file name was encrypted.

HeaderSize

The pointer of the header buffer size.

Header

The header buffer to store the header data.

Return Value

Return true if it succeeds, else return false.

Comments

GetAESHeader is the API to get encrypted file header, return true if it exists, or it will return false.

BOOL

GetAESTagData(

```
IN    WCHAR*  FileName,  
IN    PULONG  TagDataSize,  
IN    UCHAR*  TagData )
```

Parameters

EaseFilter Filter Driver SDK Manual

FileName

The file name was encrypted.

TagDataSize

The pointer of the Tag Data size.

TagData

The custom tag data which was added to the header of the encrypted file.

Return Value

Return true if it succeeds, else return false.

Comments

GetTagData is the API to get the custom tag data from the encrypted file header, return true if it exists, or it will return false.

BOOL**AddIVTag(**

```
IN  WCHAR* FileName,  
IN  ULONG  IVLength,  
IN  UCHAR* IV )
```

Parameters**FileName**

The file name was encrypted.

IVLength

The initial vector length.

IV

The initial vector.

Return Value

Return true if it succeeds, else return false.

Comments

AddIVTag is the API to add the IV tag to the encrypted file if it doesn't have the iv tag set, or it will return false.

EaseFilter Filter Driver SDK Manual

BOOL

GetIVTag(

IN *WCHAR* FileName,*
IN Out *ULONG* IVLength,*
IN out *UCHAR* IV)*

Parameters

FileName

The file name was encrypted.

IVLength

The pointer to the initial vector length, the iv length always is 16, it has to be 16, it will return 0 if the file is not encrypted.

IV

The pointer to the buffer to receive the initial vector.

Return Value

Return true if it succeeds, else return false.

Comments

GetIVTag is the API to get the IV tag from the encrypted file if it has the iv tag set, or IVLength will return 0.

BOOL

DeleteIVTag(

IN *WCHAR* FileName)*

Parameters

FileName

The file name was encrypted.

Return Value

Return true if it succeeds, else return false.

Comments

GetIVTag is the API to delete the IV tag from the encrypted file if it has the iv tag set, or it will return true.

EaseFilter Filter Driver SDK Manual

How to use EaseFilter SDK

The components

The EaseFilter file system filter SDK includes two components (EaseFlt.sys and FilterAPI.dll), The EaseFlt.sys and FilterAPI.dll are different for 32bit and 64bit windows system. EaseFlt.sys is the file system filter driver which implements all the functionalities in the file system level.

FilterAPI.dll is a wrapper DLL which exports the API to the user mode applications.

To check the binary is 32 bit or 64 bit you can right click file and go to the property, then go to the "Details" tag and check the "file description" section.

Set up the filter

Install the filter driver with [InstallDriver\(\)](#) method if the driver has not been installed yet. After filter driver was installed, the filter was loaded, if not you can load the filter with command "Fltmc load EaseFlt" in dos prompt. To remove the filter driver from the system, call [UninstallDriver\(\)](#) method.

Start the filter

1. Activate the filter with API [SetRegistrationKey\(\)](#). You can request the trial license key with the link: <http://www.easefilter.com/Order.htm> or email us info@easefilter.com
2. After register the callback function with API [RegisterMessageCallback](#), filter is started.

```
BOOL ret = RegisterMessageCallback( FilterConnectionThreadsCount, MessageCallback, DisconnectCallback);
```

3. Setup the filter configuration after filter was started. First select the filter type, then add filter rule and register the I/O request:

```
BOOL ret = SetFilterType(FILE_SYSTEM_MONITOR);  
BOOL ret = AddFileFilterRule (AccessFlags,L"C:\\MyMonitorFolder*", FilterRuleId);  
BOOL ret = RegisterIORequest(POST_CREATE|POST_CLEANUP);
```

We provide C++ example and C# example to demonstrate how to use the EaseFilter File System Monitor and Control Filter.

C++ Example

Copy the correct version (32bit or 64bit) EaseFlt.sys, FilterAPI.DLL,FilterAPI.h and FilterAPI.lib to your folder. FilterAPI.h file includes all the functions and structures used for connecting to the filter driver. WinDataStructures.h file is part of the structures of windows API which is used in the example, for more structures please reference Microsoft MSDN website.

EaseFilter Filter Driver SDK Manual

For monitor filter, it will only display the file system call messages which include process Id, Thread Id, file name, user name, file system I/O type, etc.

For Control filter, the filter will block and wait for the response if that I/O was registered, so it is better handle this request as soon as possible, or it will block the system call.

C# Example

Copy the correct version (32bit or 64bit) EaseFlt.sys, FilterAPI.DLL and FilterAPI.cs to your folder. FilterAPI.cs has the structures and APIs used for connecting to the filter driver.

For more programming detail, go to : <http://www.easefilter.com/programming.htm>
